

VividCortex Supports Performance Monitoring for Amazon Aurora

Identify and solve problems deep within distributed, hybrid databases

Amazon Aurora is Amazon's cloud-native hosted relational database. Compatible with MySQL 5.6, Aurora claims much higher throughput than MySQL, along with the flexibility and advantages of being supported by Amazon Web Services.

With VividCortex, engineering and development teams can see under the hoods of all of their Aurora database, with more clarity and depth than ever before. Quickly analyze and surface relevant insights, so you can proactively fix performance problems and ensure the reliability of your application using Amazon Aurora. To get started installing VividCortex on your Aurora system, contact sales@vividcortex.com.

Insight Into Amazon Aurora Queries

Don't waste hours analyzing query logs or manually executing and testing queries. VividCortex measures every single query that executes in production, in microsecond resolution, tracking latency, throughput, errors, warnings, and more.

Deep, Effortless Drill-Down and Zoom-in

Capture a complete view of your systems, so you don't miss relevant indicators of current and future performance issues. A visual zoom-in interface with deep drill-down, 1-second granularity, and smart analytics helps teams diagnose and solve problems faster.

Monitor Vital Amazon Aurora Metrics

VividCortex measures everything about your system. Not just a few dozen status counters, but everything. In addition to every metric exposed by Amazon Aurora, VividCortex monitors and classifies system metrics through CloudWatch.
