

VividCortex Supports Performance Monitoring for PostgreSQL

Identify and solve problems deep within distributed, hybrid databases

PostgreSQL is the world's most advanced open source database, with rock solid performance, reliability, and the feature set demanded by complex enterprise applications.

With VividCortex, engineering and development teams can see under the hoods of all of their PostgreSQL database servers, with more clarity and depth than ever before. Quickly analyze and surface relevant insights, so you can proactively fix performance problems and reinforce your application on PostgreSQL. To get started installing VividCortex on your PostgreSQL system, contact sales@vividcortex.com.

Insight Into PostgreSQL Queries

Don't waste hours analyzing PostgreSQL query logs or manually executing and testing queries. VividCortex measures every single PostgreSQL query that executes in production, in microsecond resolution, tracking latency, throughput, errors, and more.

Deep, Effortless Drill-Down and Zoom-in

Capture a complete view of your systems, so you don't miss relevant indicators of current and future performance issues. A visual zoom-in interface with deep drill-down, 1-second granularity, and smart analytics help engineering teams diagnose and solve problems faster.

Monitor Vital PostgreSQL Metrics

VividCortex measures everything about your system. Not just a few dozen status counters, but everything. In addition to every metric exposed by PostgreSQL, VividCortex monitors and classifies multi-dimensional data on every query, user, schema, process, disk, CPU, and many other system components.
